Compact Counter

Cache Cassette

The secure solution to transport currency, checks, gift certificates and credit card slips

The Compact Counter Cache Cassette has all the advantages of the popular existing cassette and more. Developed over a period of two years and building upon 15 years of on the job experience, the Compact Cache Cassette offers a greatly improved 'tried and tested' secure solution of transporting currency, checks, gift certificates and credit card slips from the check-out to the point of reconciliation. Mounted at Point of Sale, merely transfer the currency from your cash drawer into the cassette. The horizontal method of pushing the currency into the cassette eliminates jams and presents the contents flat and ready for counting. The Compact Counter Cache has all the benefits of being able to perform your cash pickups at a time that is most convenient to you, when staff is less at risk, customer lines are at their smallest and you can ensure the least amount of disruption for everyone. Rest assured the Compact Counter Cache Cassette will pay for itself in no time by reducing both collection and reconciliation time.

- Deposit 1-20 currency sized pieces of paper to a capacity of 350
- Temporary storage of individual register contents at Point of Sale or in you're over night safe
- Patented horizontal pusher action ensures smoother operation and creates a neatly stacked and presented pile for swift counting
- Accepts US and any other currency denominations

Product Design has a patented pusher action and horizontal storage mechanism maintaining a smooth operating procedure. The unit will receive 1-20 items at one time. The currency sized pieces of paper are then horizontally compressed in the internal cassette, ensuring the maximum capacity of 350 notes can be stored during trading shifts. On opening the cassette, the internal spring mechanism pushes the contents out in an orderly fashion, creating a neat and carefully stacked pile ready for swift transfer to a friction bill counter or CountEasy currency scale for counting.

- Robust metal unit mounted out of sight at Point of Sale
- 'Anti-fish' deposit drawer with locking mechanism
- Tamper evident security seals

Security is the main concern, in the design of the Compact Counter Cache model. A number of safety devices have been built in to protect both your hard-earned cash and your staff. The deposit drawer can only be opened far enough to deposit between 1 - 20 items and then a locking mechanism prevents any further outward movement. Once the items are deposited and the drawer has been closed, it cannot be re-opened until the contents have been plunged into the main unit. The whole concept of the system makes the unit less prone to manipulation. Cassettes can only be removed using a special security keyplate, which in turn seals the contents.

- Various mounting options
- Simplified repair and unit replacement
- Seamless exchange of internal receptacle

Mounting the Compact Counter Cache unit is easy. Mounted at Point of Sale and various mounting options optimize space limitations. If changing over from the Counter Cache models I & II, mounting channel holes can be adapted and disruption minimize. Repairs or replacements can be carried out in seconds, negating the need for long periods of 'down time' and ensuring a continuation of use. The robust metal clad unit is always set way back under its adopted mounting surface. This not only means its profile is less prominent, obscuring it from view and making it less likely to be seen by potential thieves, it also reduces the opportunity to force removal of the complete unit by minimizing leverage. Not completely hidden however, it is still visible enough to deter would be thieves if cash is not easily accessible.
